

For this activity, we used a Sequencer to tell about an individual. We recorded name, age, town, school name, family members, pets and favorite hobbies/interests. An actual photo could be used in place of the Picture Communication Symbol.

Individuals with Autism often have difficulty with social interaction. Sequential messaging is a great way to script appropriate interactions. The use of a voice output device should be considered even for individuals that are verbal. It can be used to role play appropriate interactions or even as a backup for times when verbalizing becomes difficult due to stress or other unknown interfering factors. The VoicePal Levels also offers sequential messaging.
