

In this example, a SwitchBoard is paired with a VoicePal 8K. An overlay for the VoicePal 8K was created with BoardMaker. Picture cues for the SwitchBoard were also printed from Boardmaker and inserted into the switch pocket. Miniature and actual objects representing each picture cue are attached to the outside of each SwitchBoard pocket. Messages recorded into the VoicePal 8K can be activated simply by touching the objects, pulling them off or attaching the objects to the matching picture cue. The VoicePal 8K keypad also remains active. The activity represented is a recipe. The amount of information given with each message is controlled by what you record. For example, the message played when the wire whisk is touched might simply say “stir” or it could say “stir 50 times until well moistened.” This allows for customized messages meeting the individual needs of the client. The VoicePal 8 and VoicePal Levels can also accommodate the SwitchBoard.
